

2022 Battery Catalog

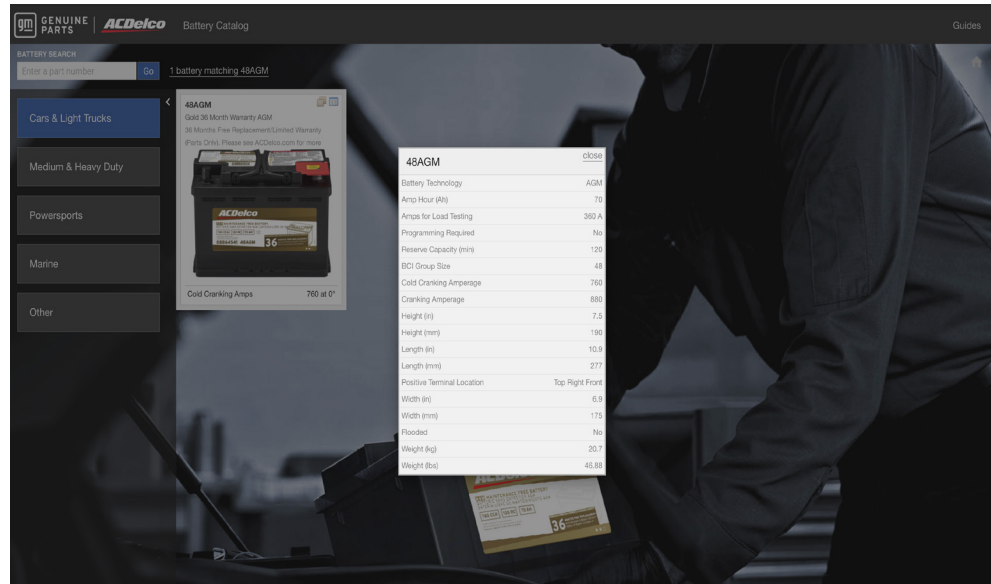

7A-100-22, supersedes 7A-100-19

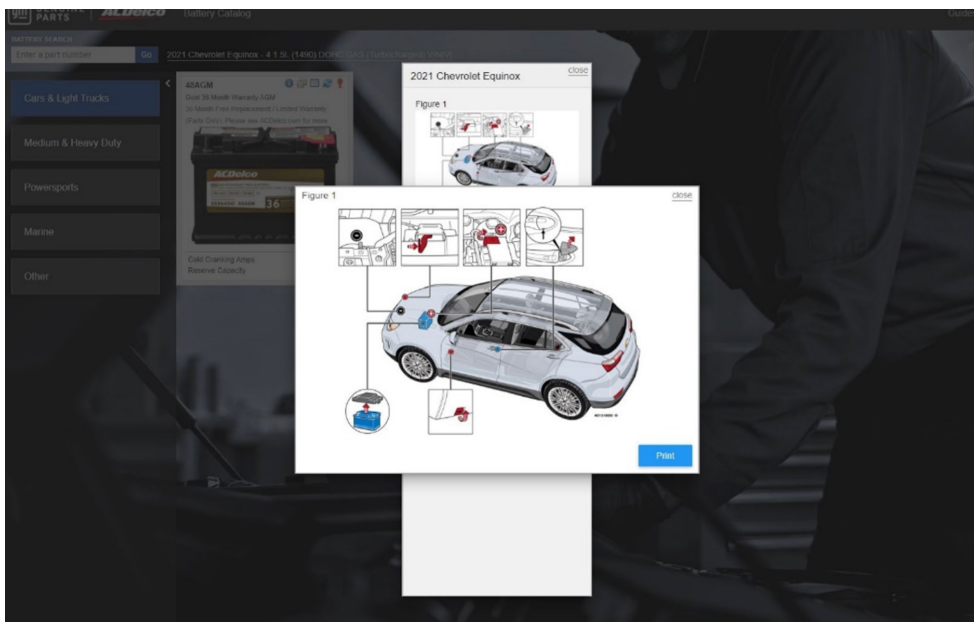

ACDelco ONLINE BATTERY CATALOG

For even more helpful tools, visit the online Battery Catalog found in CONNECTION, ACDelco's B2B parts online ordering tool, or through acdelcocanada.com.

Easily look up the battery for your application whether it be Automotive, Medium & Heavy Duty, Marine, or Powersports, listed by year, make, model, and engine where appropriate. Specific battery criteria can also be searched using the "Other" feature. Easily review Technical Data on each battery.

The *Battery Locator* helps show where the battery is installed and visual steps to access it.

Reset guides outline mandatory reset procedures after a battery has been replaced on applicable vehicles.

The above image is an example of an ACDelco battery Danger/Poison label.

Danger of Exploding Batteries

Batteries contain sulfuric acid and produce explosive mixtures of hydrogen and oxygen. Because self-discharge action generates hydrogen gas even when the battery is not in operation, make sure batteries are stored and worked on in a well-ventilated area. ALWAYS wear safety glasses and a face shield when working on or near batteries.

When working with batteries:

- **Always wear proper eye, face, and hand protection.**
- Keep all sparks, flames, and cigarettes away from the battery.
- **Do not remove or damage vent caps.**
- Make sure work area is well ventilated.
- **Never lean over battery** while boosting, testing, or charging.

Safe Battery Installation

To assure safe installation and proper operation, follow these installation procedures:

- **Disconnect ground cable first** (this is usually the negative cable; however, older vehicles may have a positive ground).
- Remove battery - note position of positive (+) and negative (-) terminals. **Mark the cables for correct connection to replacement battery.**
- Clean terminals and cable connections with a wire brush. Broken connections and frayed or cut cables should be replaced.
- Install the replacement battery in the same position as the old one. **Secure battery with the hold-down assembly.**
- Make sure the terminals do not touch any metal mounting, engine, or body parts.
- Connect cables tightly. **Connect ground cable last to avoid sparks.**
- Be sure to follow your battery manufacturer's proper venting instructions.

Safe Handling of Battery Acid

Battery acid, or electrolyte, is a solution of sulfuric acid and water that can destroy clothing and burn the skin. Use extreme caution when handling electrolyte and keep an acid-neutralizing solution - such as baking soda or household ammonia mixed with water - readily available.

When handling battery acid:

- **Always wear proper eye, face, and hand protection.**
- If the electrolyte is splashed into an eye, immediately force the eye open and flood it with clean, cool water for at least 15 minutes. Get prompt medical attention.
- If electrolyte is taken internally, drink large quantities of water or milk. **NO NOT** induce vomiting. Call a physician immediately.
- Neutralize any electrolyte that spills on a vehicle or in the work area with baking soda. After neutralizing, rinse the contaminated area clean with water.

To prepare electrolyte of a desired specific gravity, always pour the concentrated acid slowly into the water; **DO NOT pour water into acid.** Always stir the water while adding small amounts of acid. If noticeable heat develops, allow the solution to cool before continuing to add acid.

California Proposition 65 WARNING

WARNING: Battery posts, terminals and related accessories can expose you to chemicals including lead and lead compounds, which are known to the State of California to cause cancer and birth defects or other reproductive harm. Wash hands after handling. For more information go to www.P65Warnings.ca.gov.

Heat Shield - Caution

Protective heat shields around batteries are being used with increasing frequency to protect the battery from very high under-hood temperatures. Failure to replace the heat shield after installation of a replacement battery may reduce its electrical performance and/or life.

Notes:

Ⓢ Rod End Types – Extend top ledge with holes for holddown bolts.

Ⓢ Not in application section but still manufactured.

Ⓢ Maximum height dimension shown includes batteries with raised quarter cover design.

Flat-top design model height (minus quarter covers) reduced by approximately 3/8 inch (10mm)

① Ratings for batteries recommended for Motor Coach and Bus service are for double insulation. When double insulation is used in other types, deduct 15% from the rating values for Cold Cranking Performance.

② Submersible

Ⓢ Capacity tested in minutes at 75 amperes to 1.75 volts per cell at 80°F (27°C).

Ⓢ Capacity tested in minutes at 56 amperes to 1.75 volts per cell at 80°F (27°C).

Ⓢ 148 is equivalent to a reversed termination 48 (H6)

Caution

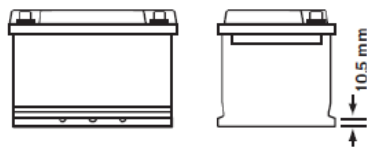

These are common holddown types but others may be used.

Holddown Descriptions:

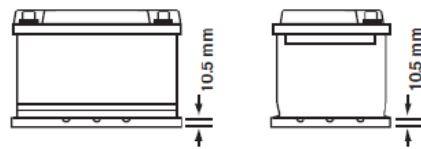

B1 = 10.5 mm high with 3 or 5 notches on sides only

B3 = 10.5 mm high on sides with 3 or 5 notches on sides and 3 notches on ends

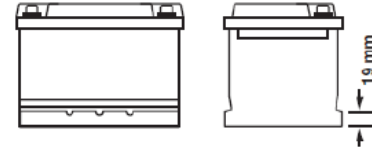

B4 = 19.0 mm high on sides only with 3 or 5 notches on sides only

B1
Base holddown 10.5 mm (on long sides)

B3
Base holddown 10.5 mm (on long and short sides)

B4
Base holddown 19 mm (on long sides)

Notes:

- ® OEM post may be small diameter JIS size, connector change may be required
- ⊙ BCI designated Group 4D is 38 mm wider than JIS part, 4D will fit most JIS applications
- ® BCI Group 29H is 76 mm shorter in length than JIS Designated part
- ⊙ OE Battery is valve regulated lead battery

JIS Number Interpretation:

52 = DIN/EN battery part number

New Battery Testing:

When checking the condition of a new battery prior to installation, ACDelco recommends only measuring open circuit voltage (OCV). ACDelco recommends a minimum installation OCV of 12.4 volts for a 12-volt battery, 8.3 volts for an 8-volt battery, and 6.2 volts for a 6-volt battery.

1. Batteries that fall below the minimum voltage should be recharged, prior to installation.
2. The battery should be tested with a known, good Digital Volt Ohm Meter (DVOM).
3. When testing side terminal or top stud batteries, always use Lead (Pb) terminal adapters. Make sure the terminal adapter makes good contact with the Lead pad of the battery or inaccurate readings will result. Basic hand tools may be needed to ensure the terminal adapter is tight.
4. Never use steel bolts/nuts/washers, etc., when testing a side terminal battery.
5. Never clamp the tester's leads directly to the threads when testing a top stud battery.

Charging Instructions:

NOTE: Before charging a battery, visually inspect the battery. If there is any sign of damage or the battery is broken, replace the battery. If the battery appears to be in good condition, follow the charging instructions below.

Never attempt to charge a battery without first reviewing the instructions for the charger being used. It is recommended that automatic chargers be used that will terminate the charging cycle of the battery automatically.

- Check the Open Circuit Voltage (OCV).
 - Test the battery with a Conductance Tester (used batteries only)
 - Three of the following results may occur: the battery is good, you may have to charge the battery and retest (you can follow the charging instructions below), or you may need to replace the battery. (This is on a battery that has been in service for a period of time.)

Flooded Batteries

Fast charging at a high rate of current is not recommended for conventional flooded batteries as it may shorten battery life; slow charging is preferred. General guidelines for charging ACDelco Batteries are given here:

1. Use terminal adapter tools when charging or testing stud or side-terminal batteries outside of the vehicle.
2. Connect charger leads to the terminal studs/nuts when charging or testing stud or side-terminal batteries in the vehicle.
3. Charge rates between 3 and 10 amps are acceptable if the battery charging voltage does not exceed 15.5 volts, the electrolyte doesn't spew from the vent holes, or the battery does not feel excessively hot ($>125^{\circ}\text{F}$). Estimate the battery temperature by feeling the case or using an IR sensor. Reduce the charging rate, as needed, to reduce electrolyte gassing or excessive heating.
4. Batteries under charge should be inspected every 2 hours; do not charge overnight. A confirmation OCV (open circuit voltage) can be performed 8 hours after charging or after the surface charge has been removed (30 second discharge at 300 amps, wait 30 seconds before measuring the OCV).
 - Once fully charged, charging must stop. **Do not leave battery on a continuous trickle charger.**
5. The time required for a proper charge will vary according to:
 - a. Battery size or capacity
 - b. Electrolyte temperature
 - c. State-of-charge
 - d. Battery age or condition
 - e. Charger capacity

BATTERY TEST AND CHARGING PROCEDURES

Estimated Charging Hours @ 10 amps current*

% SOC (State-of-Charge) using OCV (Open Circuit Voltage)

		%	10%	20%	30%	40%	50%	60%	70%	80%	90%	100%

*Assumes charger has constant voltage (15.0-16.0) and current steps down as SOC approaches 100%.
Charging efficiency estimated to be 75%. Results may vary.

AGM / VRLA Batteries

You must use a charger that has a setting for AGM batteries.

- If the battery is above 12.7V remove surface charge and recheck via OCV
 - If the voltage still reads over 12.7V the battery is OK and can be returned to use.
 - If the battery reads below 12.7V follow the charging instructions below.
1. Prepare Terminals: Clean and wire brush contact surfaces if cables are disconnected.
 - For best results, disconnect battery from vehicle.
 2. With Charger Turned OFF - **Connect Charger**
 - SINGLE OR MULTI-BATTERY **VOLTAGE CONTROLLED** (includes Parallel Charging)
 - i. Set charger output at constant 14.4V across any battery, with 20 ampere maximum.
 - ii. Monitor voltage and current into each battery hourly.
 - iii. When voltage into a single battery falls to 1 amp or below, that battery is charged.
 - iv. Turn charger OFF and remove charged battery from circuit.
 - v. Reconnect remaining batteries and resume charge (see step i).
 3. Once charged the battery is ready to be returned to use.
 - Charging AGM batteries is different than charging a Flooded battery. Make sure there is an AGM setting on your battery charger.
 - **IMPORTANT!** For chargers that are not self-adjusting, use the guidelines that most closely describe the charger being used.
 - Batteries must be monitored every two hours during charging cycle. Once fully charged, charging must stop. **Do not leave battery on a continuous trickle charger.**
 - Chargers must have an AGM switch to ensure correct voltage is being used.
 - If the charger controls offer manual voltage adjustments, use VOLTAGE CONTROLLED information. The charger must be capable of producing 14.4 volts or less.
 - **IMPORTANT!** If battery becomes hot to touch, stop the charge and allow battery to rest overnight.
 - **To remove surface charge:** Apply a 300-ampere load for 15 seconds. Allow battery to rest 15 seconds or until OCV stabilizes.

Conventional Powersports Batteries:

1. Battery Preparation - Place battery on a flat surface in a well-ventilated area.
 - a. Remove red vent plug and discard.

WARNING!

DO NOT reattach red plug after filling battery with acid!

- b. Remove plastic vent caps and retain.
2. Filling Instructions - Fill battery with acid to upper level (a). Let battery stand for 60-minutes before charging. Gently move battery from side-to-side to release any air bubbles between the plates. If acid level has fallen, refill with acid to upper level.

NOTE: This will be the last time electrolyte (acid) should be added. Return unused acid to the place where you purchased the battery or neutralize acid with an equal amount of baking soda.

3. Charging Instructions
 - a. An initial charge is required, for best results and maximum life, use a 500 mA Trickle Charger (see chart for the proper charging time for your battery). To prevent accidental release of acid during charging, place caps loosely over access ports. Charge for the period indicated in the chart. Replace caps firmly, wash off any acid spillage with water and dry battery.
 - b. Check battery voltage after correct charging time and let stand for 1-2 hours. Voltage should read 12.70 on a 12-volt battery. If voltage is below specified voltage, continue charging for an additional 40% of the total charging time (example: 40% of 10 hrs. = 4 hrs. additional charging time).

NOTE: If you have a 0.5 Amp up to 1.50 Amp charger, use the automatic setting and charge until charger indicates complete charge or battery gases freely. The voltage should read 12.70 V. Replace vent caps firmly, wash off any acid spillage with water and dry battery.

- c. After charging, attach clear vent tube. Be sure there are no bends, and that tube is free of blockage.

WARNING!

DO NOT exceed Charging Guidelines that are listed on the chart.

Prolonged charging or use of a constant current charger could shorten battery life.

4. Removal/Installation
 - a. Remove old battery. Mark which cable is connected to the Positive (+) and Negative (-) posts. Clean cable terminals with wire brush or sandpaper to remove oxidation. Position new fully charged battery on tray, connect clear vent tube to battery, ensuring there are no crimps, folds or blockages. Replace hold-down.
 - b. Connect terminals
 - i. Positive (+) red cable from ignition to Positive Post.
 - ii. Negative (-) black cable from engine or chassis to Negative Post.

Charging Guidelines:

Using a charger with an output of 1.0 amps the initial charge time of the battery will be approximately 1/2 to 1 x the amp hour rating for that battery. Full charge voltage for a flooded battery is approximately 12.7V to 12.8V.

- Once fully charged, charging must stop. Do not leave battery on a continuous trickle charger.

BATTERY TEST AND CHARGING PROCEDURES

CONVENTIONAL POWER SPORTS BATTERIES				
Charging Time (12-Volt Battery)				
Battery Capacity	Charger Amperage			
	3A	2A	1A	0.5A
2-4 Ah	-	0.5-1 Hr	1-2 Hr	2-4 Hr
5-8 Ah	-	2-3 Hr	3-5 Hr	5-8 Hr
9-12 Ah	-	3-6 Hr	5-9 Hr	9-11 Hr
14-19 Ah	5-7 Hr	6-8 Hr	8-12 Hr	12-16 Hr
20-32 Ah	8-10 Hr	8-12 Hr	12-16 Hr	16-24 Hr

AGM Powersports Batteries

1. Battery Preparation - Place the battery stand on level surface. Remove the sealing sheet.
2. Preparing the Electrolyte - Take the electrolyte container out of the inner box.

NOTE: Do not peel or pierce the sealed areas.

3. Procedure for filling battery with acid. Place electrolyte container upside down with the six sealed areas in line with the six filler ports of the battery. Push the container down strongly enough to break the seals. Now the electrolyte should start to flow out.

NOTE: Do not tilt the container as the electrolyte flow may be interrupted and stop flowing.

4. Checking the Electrolyte flow - Make sure air bubbles are coming up from the six filler ports. Leave the container in this state for 20-minutes or longer until all electrolyte has flowed into the battery.

NOTE: If no air bubbles are coming up from filler port, tap the bottom of the bottle two or three times. NEVER remove the container from the battery.

5. Pulling out the container - Be certain that all the electrolyte has flowed out. Tap the bottom if there is any electrolyte left in the container. Now pull the container gently out of the battery being careful not to drip any amount of remaining electrolyte.
6. Sealing the battery - Fit the strip of caps tightly into the filler ports. Make sure the strip is the same level as the top of the battery. The fill-up procedure is now complete. This is a permanent seal, never remove the strip of caps, or add any water or electrolyte. The battery is maintenance free under normal operating conditions.

7. Standby 1 hour

8. Charging instructions for Maintenance-free batteries

- a. These Batteries are of sealed maintenance-free construction which means:

- i. Never add water
- ii. Use a 12-volt 0.5~1.5-amp motorcycle battery charger.

WARNING! - Do not exceed Charging Guidelines that are listed on the chart.

9. Installation - Position the battery in holder and fasten firmly to vehicle.

- b. Connect terminals:

- i. Positive (+) red cable from ignition to Positive Post.
- ii. Negative (-) black cable from engine or chassis to Negative Post.

Using a charger with an output of 1.0 amps the initial charge of the battery will be approximately 1/2 to 1x the amp hour rating for that battery. Full charge voltage for a Maintenance Free battery is approximately 12.7V to 12.8V.

•• Once fully charged, charging must stop. **Do not leave battery on a continuous trickle charger.**

AGM Power Sport Batteries			
Charging Time (12-Volt Battery)			
Battery Capacity	Charger Amperage		
	2A	1A	0.5A
2-4 Ah	0.5 Hr	1 Hr	1-2 Hr
5-8 Ah	1-2 Hr	2-3 Hr	3-4 Hr
9-12 Ah	2-3 Hr	3-7 Hr	8-10 Hr
14-19 Ah	4-6 Hr	6-10 Hr	13-18 Hr
20-32 Ah	5-7 Hr	8-12 Hr	18-24 Hr

Never attempt to charge a battery without first reviewing the instructions for the charger being used. It is recommended that automatic chargers be used that will terminate the charging cycle of the battery automatically.

Marine/RV Flooded Batteries

Fast charging at a high rate of current is not recommended; it may shorten battery life. Slow charging is preferred. General guidelines for charging ACDelco Batteries are given here:

1. Use terminal adapter tools when charging or testing stud or side-terminal batteries outside of the vehicle.
2. Connect charger leads to the terminal studs/nuts when charging or testing stud or side-terminal batteries in the vehicle.
3. Recharge battery after each use.
4. Use a taper type charger set at 15.0 volts: For best results, a 10-15 amp taper type charger is recommended to recharge ACDelco Voyager models. Taper chargers help avoid overcharge by reducing the charge rate as the battery nears full charge. Follow instructions provided with the charger.
5. Determine the charging time that will be required. If equipped, check the built-in indicator and charge the battery for at least the number of hours shown in the charging table (located in "Charging Instructions" section). If the green ball is not visible in the indicator after charging, tap lightly on top to dislodge trapped air bubbles that might keep the ball from floating into view. For the most accurate results allow the battery to rest for 12 hours then measure battery voltage, 12.75 volts is fully charged. **NOTE:** A more definite charging time can be set if an accurate voltmeter is available for reading open circuit voltage.
6. DO NOT leave a battery connected to a battery charger after the battery is fully charged. Leaving the battery on a 'float' charge can damage the battery. Inspect battery every 2 hours when charging.
 - Once fully charged, charging must stop. **Do not leave battery on a continuous trickle charger.**
7. Batteries charge more efficiently at 60° to 80°F. Turn off charger if battery is hot.
8. If the hydrometer or acid level indicator is clear do not charge the battery, remove from use and replace.
9. The time required for a proper charge will vary according to:
 - Battery size or capacity
 - Electrolyte temperature
 - State-of- charge
 - Battery age or condition
 - Charger capacity

*Assumes charger has constant voltage (15.0-16.0) and current steps down as SOC approaches 100%.

Charging efficiency estimated to be 75%. Results may vary.

Marine/RV Deep Cycle Batteries:

The ACDelco Professional Voyager Deep Cycle and ACDelco Advantage Voyager II Deep Cycle batteries are deep cycling batteries that will give hours of electrical power in recreational vehicle and boating applications. The battery is an energy storage reservoir. When energy is removed from the battery it must be put back by recharging. The amount of energy required to be put back depends on how much was taken out. The time it will take to recharge will depend on the ampere output of the charger used. The ACDelco Professional Voyage Deep Cycle batteries have a built-in state-of-charge indicator to show how much energy is left in the battery. A green colored ball or red colored ball may be visible in the indicator, or no ball may be visible causing the indicator to appear dark. The indicator is also used to determine how long the battery should be recharged as follows:

INDICATOR COLOR	CLEAR	RED	DARK	GREEN
STATE-OF-CHARGE	Low Electrolyte	Below 50%	50-70%	Above 70%

Fast charging at a high rate of current is not recommended; it may shorten battery life. Slow charging is preferred. General guidelines for charging ACDelco Batteries are given here:

1. Use terminal adapter tools when charging or testing stud or side-terminal batteries outside of the vehicle.
2. Connect charger leads to the terminal studs/nuts when charging or testing stud or side-terminal batteries in the vehicle.
3. Recharge battery after each use.
4. Use a taper type charger set at 15.0 volts: For best results, a 10-15 amp taper type charger is recommended to recharge ACDelco Voyager models. Taper chargers help avoid overcharge by reducing the charge rate as the battery nears full charge. Follow instructions provided with the charger.
5. Determine the charging time that will be required. If equipped, check the built-in indicator and charge the battery for at least the number of hours shown in the charging table (located in "Charging Instructions" section). If the green ball is not visible in the indicator after charging, tap lightly on top to dislodge trapped air bubbles that might keep the ball from floating into view. For the most accurate results allow the battery to rest for 12 hours then measure battery voltage, 12.75 volts is fully charged.
NOTE: A more definite charging time can be set if an accurate voltmeter is available for reading open circuit voltage.
6. DO NOT leave a battery connected to a battery charger after the battery is fully charged. Leaving the battery on a 'float' charge can damage the battery. Inspect battery every 2 hours when charging.
7. Once fully charged, charging must stop. Do not leave battery on a continuous trickle charger.
8. Batteries charge more efficiently at 60° to 80°F. Turn off charger if battery is hot.
9. If the hydrometer or acid level indicator is clear do not charge the battery, remove from use and replace.
10. The time required for a proper charge will vary according to:
 - a. Battery size or capacity
 - b. Electrolyte temperature
 - c. State-of-charge
 - d. Battery age or condition
 - e. Charger capacity

BATTERY TEST AND CHARGING PROCEDURES

Marine AGM / VRLA Batteries

You must use a charger that has a setting for AGM batteries.

- If the battery is above 12.7V remove surface charge and recheck via OCV
 - If the voltage still reads over 12.7V the battery is OK and can be returned to use.
 - If the battery reads below 12.7V follow the charging instructions below.
1. Prepare Terminals: Clean and wire brush contact surfaces if cables are disconnected.
 - For best results, disconnect battery from vehicle.
 2. With Charger Turned OFF - Connect Charger.
 - SINGLE OR MULTI-BATTERY **VOLTAGE CONTROLLED** (includes Parallel Charging)
 - i. Set charger output at constant 14.4V across any battery, with 20 ampere maximum.
 - ii. Monitor voltage and current into each battery hourly.
 - iii. When voltage into a single battery falls to 1 amp or below, that battery is charged.
 - iv. Turn charger OFF and remove charged battery from circuit.
 - v. Reconnect remaining batteries and resume charge (see step i).
 3. Once charged the battery is ready to be returned to use.
 - Charging AGM batteries is different than charging a Flooded battery. Make sure there is an AGM setting on your battery charger.
 - **IMPORTANT!** For chargers that are not self-adjusting, use the guidelines that most closely describe the charger being used.
 - Batteries must be monitored every two hours during charging cycle. Once fully charged, charging must stop. **Do not leave battery on a continuous trickle charger.**
 - Chargers must have an AGM switch to ensure correct voltage is being used.
 - • If the charger controls offer manual voltage adjustments, use VOLTAGE CONTROLLED information. The charger must be capable of producing 14.4 volts or less.
 - • **IMPORTANT!** If battery becomes hot to touch, stop the charge and allow battery to rest overnight.
 - • **To remove surface charge:** Apply a 300-ampere load for 15 seconds. Allow battery to rest 15 seconds or until OCV stabilizes.

Filler Cap Batteries

- The state of charge on filler cap batteries must be checked by measuring the strength of the electrolyte. Specific gravity (exact weight) of the electrolyte provide a measure of its strength. Pure water is lighter than the correct mixture of acid and water. A hydrometer is used to measure the specific gravity of the electrolyte in each battery cell. These readings, adjusted for the temperature of the electrolyte, are used to determine the battery's state of charge.
 - Before charging a battery, visually inspect the battery. If there is any sign of damage or the battery is broken, replace the battery. If the battery appears to be in good condition, follow the charging instructions below.
 - **Specific Gravity Check:** Hydrometer reading of all cells should be at least 1.225 and show less than 0.050 between high and low readings, at electrolyte temperature of 80°F.
 - More than 0.050 difference: replace battery. Less than 0.050, but some cells read less than 1.225: recharge battery*.
- Replace vent caps, use rate less than 50-amps, until all cells measure proper specific gravity. (If charging won't bring up specific gravity, replace battery.)
- IMPORTANT:** Not all batteries may be equipped to allow for the following tests – please use as available and necessary.
- Fast charging at a high rate of current is not recommended; it may shorten battery life. Slow charging is preferred. Filler cap batteries are expected to gas during charging. General guidelines for charging ACDelco filler cap batteries are given here.

NOTICE: During charging, leave flame arrester vent caps in place. Remove sealed caps and place a cloth over the vent holes to allow gassing. Battery should not be hot to the touch nor should its sides bow. Charge in a well-ventilated area.

1. When charging or testing a studded terminal (non-post type) battery, use terminal adapters when the battery is removed from the vehicle. Connect charger clamps to battery cable end when the battery is in vehicle.
2. The battery charging voltage must not exceed 15.5 volts, the electrolyte must not spew from the vent holes, and the battery must not feel excessively hot ($>125^{\circ}\text{F}$). The charging current may need to be reduced or temporarily stopped to prevent damage to the battery.
3. The battery is fully charged when all cells are gassing freely and no change in the electrolyte's specific gravity is noted after two hours of charging. Specific gravity should be at least 1.230.
 - Batteries may function, even with specific gravity below 1.230.
 - Emergency boost charging must be followed by full charging.
 - Once fully charged, charging must stop **Do not leave battery on a continuous trickle charger.**
4. Battery charging requires a charging current (in amperes) for a period of time (in hours).
5. The time required for a proper charge will vary according to:
 - Battery size or capacity
 - Electrolyte temperature
 - State-of-Charge
 - Battery age or condition
 - Charger capacity

NOTICE: After charging has been completed, add distilled water to adjust the electrolyte level in each cell to the bottom of the split ring.

Lawn and Garden Batteries

Fast charging at a high rate of current is not recommended; it may shorten battery life. Slow charging is preferred. General guidelines for charging ACDelco Batteries are given here:

1. Use terminal adapter tools when charging or testing stud or side-terminal batteries outside of the vehicle.
2. Connect charger leads to the terminal studs/nuts when charging or testing stud or side-terminal batteries in the vehicle.
3. Charge rates between three and 10 amps are acceptable as long as the battery charging voltage does not exceed 15.5 volts, the electrolyte doesn't spew from the vent holes, or the battery does not feel excessively hot ($>125^{\circ}\text{F}$). Estimate the battery temperature by feeling the case. Reduce the charging rate, as needed, to reduce electrolyte gassing or excessive heating.
4. Batteries under charge should be inspected every 2 hours, do not charge overnight. A confirmation OCV (open circuit voltage) can be performed 8 hours after charging and after the surface charge has been removed (30 second discharge at 300 amps; wait 30 seconds before measuring the OCV).
 - Once fully charged, charging must stop. Do not leave battery on a continuous trickle charger.
5. The time required for a proper charge will vary according to:
 - Battery size or capacity
 - Electrolyte temperature
 - State-of-charge
 - Battery age or condition
 - Charger capacity

BATTERY TEST AND CHARGING PROCEDURES

Golf Cart Batteries

ACDelco recommends charging deep cycle Golf Cart batteries using a three-stage charger: (Constant current, constant voltage, and constant current).

1. Bulk Charge: Constant current at ~10% of C20 Ah in amps to 2.40 +/-0.05 volts per cell. (e.g., 20 amps for a 200 Ah battery at 7.20 volts +/- 0.15 volts per 6 volt battery).
2. Absorption Charge: Constant voltage (2.40 +/-0.05 vpc) to 3% of C/20 Ah in amps.
3. Finish Charge: Constant current at 3% of C20 Ah to 2.55 +/-0.05 volts per cell (e.g. 6 amps for a 200 Ah battery at 7.65 volts +/-0.15 volts per 6 volt battery). Charge termination can be by maximum time (2-4 hours) or dV/dt (4 mv/cell per hour).

NOTE: Equalization and float charge modes are not considered to be one of the stages in a charging profile.

- Optional Float Charge: Constant voltage of 2.17 vpc (e.g. 6.51 volts per 6-volt battery) for unlimited time.
- Equalization Charge: Constant voltage (2.55 +/-0.05vpc) extended for 1-3 hours after normal charge cycle (repeat every 30 days).

Charging Steps:

	Three Stage Charger Steps <i>Constant Current - Constant Voltage - Constant Current</i>			Optional	Repeat Every 30 Days
Battery Voltage	Bulk Charge	Absorption Charge	Finish Charge	Float Charge	Equalization Charge
6 Volt	Constant Current at ~10% of C20 Ah in Amps at 7.05 - 7.35 Volts	Constant Voltage at 7.05 - 7.35 Volts to ~3% of C20 Ah in Amps	Constant Current at ~3% of C20 Ah in Amps to 7.50 - 7.80 Volts	Constant Voltage at 6.50 - 6.55 Volts for Unlimited Time	Constant Voltage at 7.50 - 7.80 Volts for 1 - 3 Hours
8 Volt	Constant Current at ~10% of C20 Ah in Amps at 9.40 - 9.80 Volts	Constant Voltage at 9.40 - 9.80 Volts to ~3% of C20 Ah in Amps	Constant Current at ~3% of C20 Ah in Amps to 10.00 - 10.40 Volts	Constant Voltage at 8.67 - 8.73 Volts for Unlimited Time	Constant Voltage at 10.00 - 10.40 Volts for 1 - 3 Hours
12 Volt	Constant Current at ~10% of C20 Ah in Amps at 14.10 - 14.70 Volts	Constant Voltage at 14.10 - 14.70 Volts to ~3% of C20 Ah in Amps	Constant Current at ~3% of C20 Ah in Amps to 15.00 - 15.60 Volts	Constant Voltage at 13.00 - 13.10 Volts for Unlimited Time	Constant Voltage at 15.00 - 15.60 Volts for 1 - 3 Hours

NOTES:

- Single-Stage or Two-Stage charging can be used instead of Three-Stage charging when following the charger manufacturer's instructions.
- Battery life will be extended using 'opportunity charging', i.e. charging at every opportunity to minimize depth of discharge combined with full charging regularly.
- Charge time from full discharge can be 8-12 hours (depending on depth of discharge).
- Absorption charge time is determined by the battery but will usually be ~3 hours at 2.40 +/-0.05 vpc
- Finish charge time is typically 2-4 hours.
- Float time is unlimited at 2.17 volts per cell, as long as the charger is monitored every 24 hours.
- Specific gravity at full charge is 1.270 minimum.
- Battery voltage adjustment for temperature: reduce the voltage by 0.028 volts per cell for every 10°F above 80°F, increase by the same amount for temperatures below 80°F.
- Once the battery is fully charged, charging must stop unless the charger has a programmed float charge mode with periodic refresh mode.

Do not leave battery on an unregulated continuous trickle charger.

Checking Open Circuit Voltage:

OCV may be used to estimate the battery state-of-charge . Observe the following guidelines:

- Use a voltmeter that has been verified as accurate. An inaccurate meter will give inaccurate results. The meter should read to the nearest 0 .01 volts.
- When checking OCV, the vehicle engine and all current drains must be OFF. Any current flow into or out of the battery will cause an incorrect voltage reading.
- The battery must be stabilized before reading the OCV . If the battery has been charged or used in a vehicle in the past 12 hours, remove the surface charge (apply a 300 amp load for 15 seconds) . If the battery has just been discharged, allow at least 30 seconds for the voltage to stabilize, then read the OCV .
- Use the following table to estimate the state-of-charge based on the battery temperature:

Stabilized OCV (Volts)		% Charge* at 0°C (32°F)	% Charge* at 25°C (75°F)
12 volt	12.75	100%	100%
	12.70	100%	90%
	12.60	90%	75%
	12.45	75%	65%
	12.20	65%	45%
8 volt	8.48	100%	100%
	8.42	100%	90%
	8.32	90%	75%
	8.27	75%	65%
	8.21	65%	45%
6 volt	6.37	100%	100%
	6.32	100%	90%
	6.27	90%	75%
	6.22	75%	64%
	6.16	65%	45%

*Estimates only. Batteries vary +10% by model.

- Keep batteries at 65% of full charge or higher . If the OCV falls below 12 .4V, recharge the battery .
- **IMPORTANT:** When a battery needs charging, always charge it fully . If you don't:
 - o Retests with electronic testers may be inaccurate .
 - o Full shelf life will not be available if returned to storage .

BATTERY HANDLING, STORAGE, AND DISPOSAL

Recommendations for Proper Battery Handling:

- **PROPOSITION 65 WARNING:** Battery posts, terminals and related accessories contain Lead and Lead compounds, chemicals known to the state of California to cause cancer, birth defects and other reproductive harm. Batteries also contain other chemicals known to the state of California to cause cancer. WASH HANDS AFTER HANDLING!
- **WARNING:** Sulfuric Acid can cause blindness or severe burns.
- Shield eyes explosive gases can cause blindness or injury.
- **DANGER:** Cigarettes, flame or sparks could cause battery to explode. Always shield eyes and face from battery. Do not charge or use booster cables or adjust post connections without proper instruction and training. KEEP VENT CAPS TIGHT AND LEVEL.
- **CAUTION:** All lead-acid batteries generate hydrogen gas, which is highly flammable. If ignited by a flame or spark, the gas may explode violently. When working near batteries, always wear safety glasses, remove watches or jewelry, and avoid causing sparks with tools. KEEP OUT OF REACH OF CHILDREN.
- If splashed with acid, immediately flush area with water and seek medical attention.
- If treated with care and taking the proper precautions, lead acid batteries can be handled safely with minimum risk. However, lead acid batteries contain sulfuric acid which is both poisonous and corrosive. This makes them potentially hazardous and can cause serious injury when standard handling procedures and safety measures are not respected.
- Lifting tools are available for carrying batteries. ACDelco recommends the type that grasps the battery case. When grasping the case, do so on the sides, not on the ends. This transfers pressure to the cell partitions and prevents the case from flexing.
- Movement of the case under the lifting tool pads can cause the battery to slip out of the tool. Do not tilt the batteries when carrying them.
- Keep the battery within 45° of level as it is moved into the vehicle. Tilting the battery beyond this amount causes the internal vent system to become flooded with electrolyte and may result in acid leaking from the vents.
- In the event the battery is temporarily tilted beyond these limits, no harm will usually be done to the battery unless significant electrolyte leaks out through a vent port. Internal baffles in the battery will normally return the electrolyte to the cell areas if the battery is promptly set upright and allowed to stand without use for a short period of time to permit the internal baffle areas to drain. If the battery is used too quickly, internal gassing can push the displaced electrolyte out through a vent port as liquid or foam.
- Golf Cart batteries require the removal of vent caps to refill with distilled water Proper care must be taken to prevent spilling acid Lead acid batteries contain sulfuric acid which is both poisonous and corrosive This makes them potentially hazardous and can cause serious injury when standard handling procedures and safety measures are not respected.
- Do not tilt the battery.

Recommendations for Proper Battery Storage:

Fully charged ACDelco Batteries (OCV is ≥ 12.7) should be stored in an upright position at temperatures above freezing (32 degrees Fahrenheit, 0 degrees Celsius). When a battery is stored, a very slow chemical reaction takes place between the plate materials and the electrolyte, causing a slow discharge This reaction, called self-discharge, occurs more rapidly at higher temperatures therefore it is not recommended to store batteries near a furnace or other heat source. If a battery is completely discharged, the electrolyte will freeze when stored below 30 degrees Fahrenheit (-1.1 degrees Celsius). To prevent electrolyte freezing and battery damage, keep batteries charged and do not store batteries below 30 degrees Fahrenheit (-1.1 degrees Celsius) if their OCV is less than 12.45 volts. Batteries in storage should be checked at regular intervals and charged if they fall below 12.4 volts to help maintain service life. The suggested interval is based on storage temperature:

Average Storage Temperature		Recharge Fully at
21•C or below	70°F or below	9 months
21-27°C	70-80°F	6 months
27-32°C	80-90°F	4 months
32-38°C	90-100°F	2 months
38°C or higher	100°F or higher	1 month

Deep Cycle and Golf Cart Batteries:

Deep Cycle batteries are more susceptible to damaging sulfation during storage than starter type batteries and should be kept at a high state of charge to help maintain service life. It is suggested to keep Deep Cycle and Golf Cart batteries in storage above the following voltages:

6-Volt Battery: 6.2 volts

8-Volt Battery: 8.35 volts

12-Volt Battery: 12.4 volts

Recommendations for Proper Battery Disposal:

Remember batteries contain acid and lead, and even worn-out batteries can produce a current if the terminals are accidentally shorted together. All Lead Acid (Flooded or AGM) batteries should be recycled. ACDelco's battery recycling program makes it easy to recycle old batteries*. Just take your old battery to an ACDelco Battery retailer or authorized service provider.

**Other Battery types such as (but not exclusive to) Lithium-Ion, Nickel metal (NIMH), and Ni-Cadmium, should never be recycled with lead acid batteries as they can pose a serious safety risk.*

WARNING

Follow appropriate safe handling practices including, but not limited to:

- Keep terminal protectors in place on batteries that are not in use.
- Never throw an automotive battery in the trash. Always dispose of unwanted batteries via approved battery recyclers.
- Follow all local environmental regulations.
- Keep sparks and flames away from the battery.
- Do not smoke near the battery.
- Keep metal objects away from the terminals of the battery (even a used battery can have significant electrical energy).
- Remove rings, chains, and other metallic objects from your body before handling the battery.
- Wear gloves and safety glasses and avoid acid contact with your eyes, skin, and clothing.
- Use a battery carrier to lift the battery and avoid putting excessive pressure on the ends of the battery.
- Keep the battery right side up and transport it in a nonmetallic, leak-proof container. If you remove the battery from service, but don't intend to transport it to the drop-off site immediately, place it in a secure location away from children and pets.
- Don't store batteries at or below freezing. Frozen batteries can crack and leak sulfuric acid.
- If you spill any acid, use a solution of baking soda and water to neutralize the acid.
- Rinse the contaminated surface with water.
- If the acid comes into contact with your skin, rinse the affected area with a solution of baking soda and water, rinse thoroughly, and seek medical attention.
- If the acid comes into contact with your eyes, rinse the eyes thoroughly with clear water for several minutes. Contact a physician immediately.

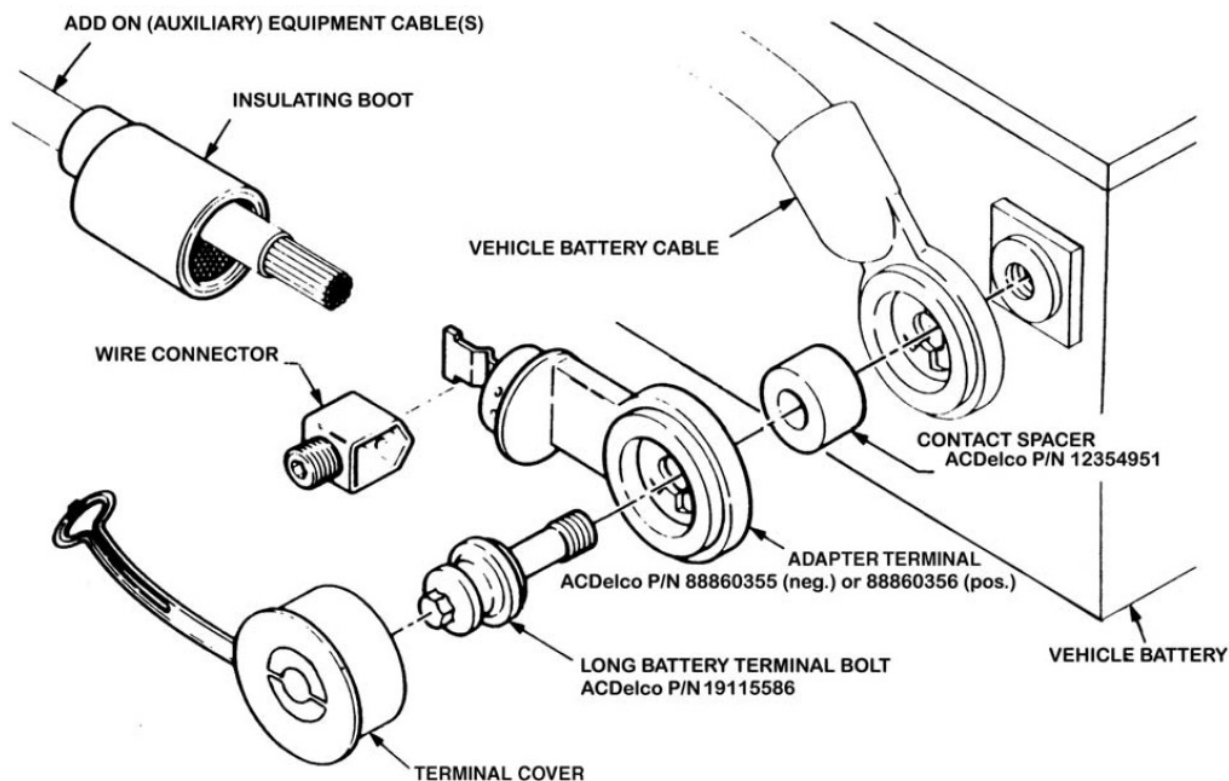

AUXILIARY ELECTRICAL EQUIPMENT INSTALLATIONS

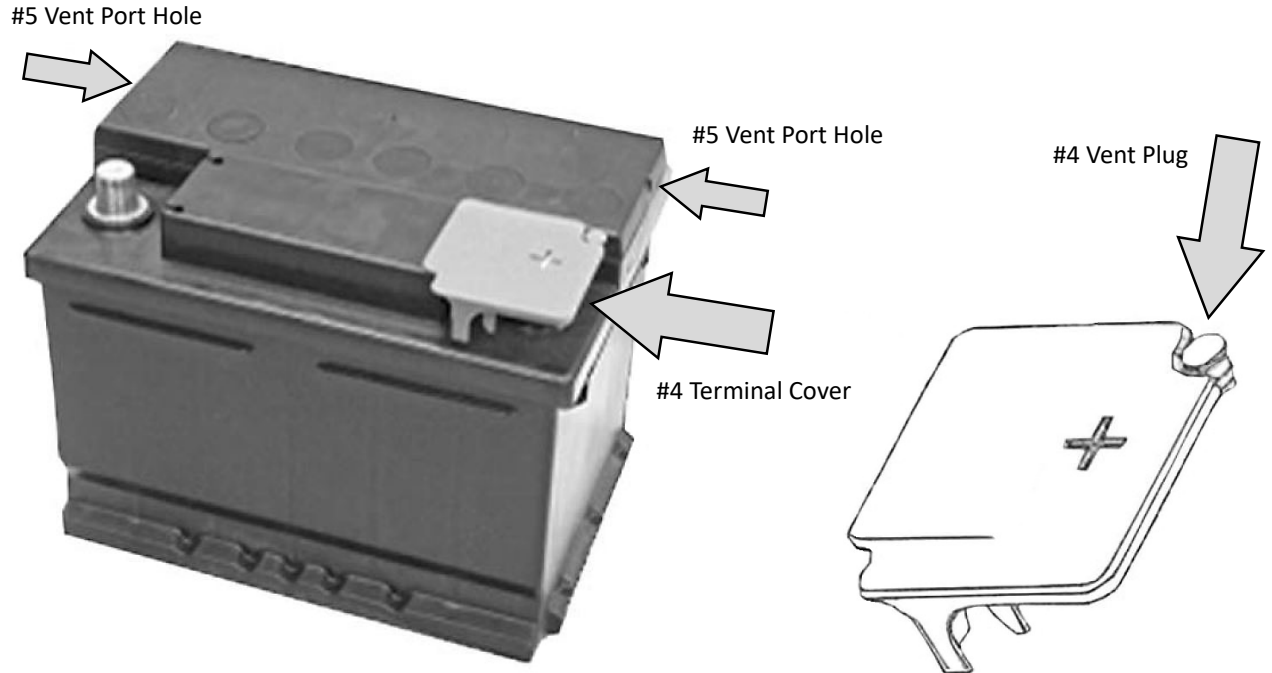

The use of add-on auxiliary electrical equipment (mobile radios, light bars, etc.) on vehicles often requires that both power and ground connections be made at the battery.

ACDelco has the parts to make these connections while maintaining the corrosion resistance and electrical integrity designed into the ACDelco side terminal battery.

Side terminal adapters (see ACDelco Wire and Cable Catalog 16A-100) in combination with our longer battery bolt 19115586 and spacer 12354951 will provide the corrosion resistant connection illustrated.

**Step-by-step guide to plug installation:**

1. Secure new battery in vehicle using hold-down.
2. If the vehicle battery has a venting system, you will have to use the plug
3. (attached to the positive terminal cover) to complete the safe installation of the battery. Vehicles without battery vents, go to step #6.
4. Connect vent tube (if provided) into closest vent hole on battery end.
5. Remove vent plug from terminal cover.
6. Install vent port opposite vent tube.
7. Install electrical cables.

For more details, check bulletin numbers GCUS-9-4837 and 17D-083.

How to use this Catalog

- Replacement battery should equal or exceed original equipment cold cranking capacity.
- Part Numbers are listed with warranty period after, for example "24G (30)" refers to a 30-Month warranty period.
- See the Auxiliary Electrical Equipment Installation information in this catalog if a retrofit from top to side terminals is required.
- This catalog contains part numbers from various product lines. To obtain additional information pertaining to non-line 07 (Battery) part numbers see the respective catalog.
- Regarding the term "OPT." (Optional):

Example:

2003 V6 3.9L	27/600
V6 3.9L OPT.	27/750
V8 5.2L	27/750
V8 5.2L OPT.	27/800

In this example "OPT." means that the group number 27 with a 600 cranking performance is standard equipment on the V6 3.9L; group 27 with a 750 cranking performance is available as an option on the V6 3.9L and as standard equipment on the V8 5.2L; group 27 with a 800 cranking performance is available as an option on the V8 5.2L.

Definitions and Battery Types

Cold Cranking Performance (SAE/BCI/JIS) Society of Automotive Engineers/ Battery Council International/Japanese Industrial Standards

The SAE/BCI/JIS Cold Cranking Performance at -18oC (0oF) is a rating used to describe battery high-rate discharge capability at low temperature. It is the discharge load in amperes that a new, fully charged battery at -18°C (0°F) can continuously deliver for 30 seconds and maintain a terminal voltage equal to or higher than 1.2 volts per cell.

Cold Cranking Performance (EN) European Norm - Including (IEC/BS) International Electrotechnical Commission/ British Standard

The EN CCA test is performed at -18°C (0°F). The EN requirement is however split into two levels, EN1 and EN2.

EN1 - The battery is required to meet a voltage of 7.5V after discharging for 10 seconds at the Battery Rating. After a 10 second rest, the battery is further discharged @ 0.6 of the original current and is required to complete 73 seconds in the second stage. The battery must be above 9.0V at 20 seconds into the second stage discharge and must be at or above 6.0V at the end of the second stage 73 second discharge. This test is for 12V batteries used primarily for automobiles with petrol engines.

EN2 is the same as the EN1 test except that the second stage discharge period to 6.0V should achieve 133 seconds. This test is used for 12V batteries in commercial vehicles and automobiles with diesel engines. The discharge current's relationship to meet both designs is very much subject to battery design and can vary from manufacturer to manufacturer and design to design. The relationship of the EN1 and EN2 is: EN2 = 85% to 92% of EN1. The relationship is usually very similar, however not exact, to the SAE/BCI/JIS CCA rating. Either of these may be the battery rating listed under the heading O.E. CCA -18°C (0°F) recommended by most vehicle manufacturers for use on each vehicle.

Sometimes a battery may have to provide power for ignition and lighting in the event of failure in the vehicle's electricity generating system or for operation of systems in some vehicle's normal function charging reduction or engine/charging off modes. The following definition defines this capability.

Ampere-Hour Capacity – 20 Hour Rate (AH) SAE/BCI/EN/JIS

The Ampere-Hour Capacity measures the total amount of electrical energy stored in a fully charged battery at a stable temperature of 25°C (77°F). The Ampere Hour Capacity varies with the given rate (Amp, A) at which the battery is discharged over a definite period of time (hours, H). The 20-Hour Capacity is the amount of amperes that a battery will deliver during a discharge at a fixed rate for 20 hours before the voltage falls to 1.75V per cell – example (10.5V for a 12V battery, 7.0V for an 8V battery or 5.25V for a 6V battery). The capacity of a battery depends upon a number of factors such as: active material weight, density of the active material, battery design, available electrolyte, temperature, internal and external resistance, age and life history of the battery. This rating is more commonly used in European, Japanese and Korean manufactured vehicles, and the industrial, marine and non-highway applications.

(Example – A BCI Group 49 12-volt battery with 100 Ah capacity rating would be discharged at a fixed rate of 5 Amps for 20 continuous hours and the end of discharge Battery voltage must be at or above 10.5 volts to pass the rating.)

Most modern vehicles typically have a single battery with a high cranking capability along with enough energy storage for primary and secondary functions of the vehicle. Many times, these batteries are rated with an Ah Rating as opposed to or in addition to the more common CCA rating. In addition to this typical single battery vehicle architecture, some vehicles use multiple batteries with differing size, configuration, and Ah rating in the same vehicle. The Ah rating will typically be listed as the C20 rating, but for an auxiliary battery in a dual (or multiple) battery system, another rating may be appropriate.

Reserve Capacity (Minutes) SAE/BCI/EN/JIS

The Reserve Capacity is the amount of time in minutes that a new, fully charged battery at 27°C (80°F) can deliver a current of 25 Amps until the voltage drops to 1.75V per cell, (10.5V for a 12V battery, 7.0V for an 8V battery or 5.25V for a 6V battery). This represents the time that a battery will continue to operate essential accessories if the alternator or generator fails, and the warning light is shown. Aside - many vehicles today have many accessories with a load greater than 25 amps. This greater dependency can reduce the listed time but does show the relative drop off in battery performance as the load of the vehicle is increased.

ACDelco has established a minimum Reserve Capacity (RC) requirement for applications covered in this catalog. The aftermarket has consistently focused on Cold Cranking Amps (CCA) as a sole indicator of battery performance, and generally only lists CCA for their applications. As vehicle electrical loads and devices continue to increase, reserve capacity (RC) plays an increasingly important role.

Cranking Amps (CA) and Marine Cranking Amps (MCA) (32 degrees Fahrenheit) is a newer rating newly utilized by BCI for applications that are rarely used below freezing. It is sometimes referred to as Marine Cranking Amps at 32 degrees Fahrenheit or MCA at 32 degrees Fahrenheit. It is the discharge load in amperes which a new, fully charged battery at 32 degrees Fahrenheit (0 degrees Celsius) can continuously deliver for 30 seconds and maintain a terminal voltage equal to or higher than 1.20 volts per cell. Since marine or boating applications operate in temperatures of 32 degrees F (0 degrees C) or higher, this temperature is chosen to describe the available marine cranking amps or "MCA Rating." For maximum battery life in Marine applications where electrical requirements are high, separate starting and running batteries are recommended.

Start-Stop

Start-Stop Vehicle Operation

Increased demands for fuel efficiency and lower environmental impact have fostered changes in the way internal combustion engine vehicles operate. In particular, time spent stopped in traffic with the vehicle engine at idle is a key source of wasted fuel. Many vehicles are therefore utilizing a relatively cost-effective method to stop the engine when the vehicle is temporarily halted. When the vehicle needs to be driven, the control system automatically restarts the engine. This is now recognized as Start-Stop operation. Start-Stop operation puts increased demands on the vehicle battery, which requires improved functionality compared to standard starter batteries. Vehicles with start-stop operation typically have an enhanced battery that was designed and manufactured specifically for these applications. Batteries used for Start-Stop operation are typically constructed Absorbent Glass Mat (AGM) designs with some (especially in other regions) utilizing Enhanced Flooded Battery (EFB) designs.

Requirements of a Start-Stop Battery

- Provide power for initial starting, and to restart the engine after frequent stop phases.
- Exclusive power for the various electrical loads in the electrical system when the engine is off.
- Deliver energy during higher cycling conditions and partial state of charge (PSOC) operation.
- Accept and recover sufficient charge to maintain normal operation during vehicle use.
- Provide calendar life as long as a SLI (starting, lighting, ignition) battery in vehicles without Start-Stop.

Battery Types

- **Flooded Battery**
A lead acid battery with free-flowing electrolyte. The construction includes a cover with one or more vents through which gaseous products may escape. Commonly called an SLI (starting, lighting, ignition), or "Starter" battery.
- **EFB Battery**
A flooded lead acid battery with enhanced cycling capability and charge recovery compared to standard flooded starter batteries.
- **AGM Battery**
A lead acid battery with electrolyte immobilized in the active material and absorbent glass mat separator material. The AGM battery is sealed under normal conditions, but allows gaseous products to escape through a pressure controlled valve (sometimes referred to as VRLA or Valve Regulated Lead Acid battery). An AGM typically has significantly improved cycling capability and charge recovery compared to standard flooded Starter batteries.

Short Definitions

CA & MCA - Rating in amperes which a new, fully charged battery at 32°F (0°C) can continuously deliver for 30 seconds and maintain a terminal voltage equal to or higher than 1.20 volts per cell.

RC - Rating in minutes a battery will carry a 25-ampere load at 80°F and maintain a minimum terminal voltage of 10.5.

CCA - Rating in amperes which a new, fully charged battery at 0°F (-17.8°C) can continuously deliver for 30 seconds and maintain terminal voltage equal to or higher than 1.20 volts per cell.

AH - @ 20 hr. rate, a battery having a 100 A.H. rating must carry a 5-ampere load (100/20 hrs. = 5 amps) for 20 hours and maintain a terminal voltage of 10.5 at 80°F.

DIN - Rating in amperes a battery cold soaked at 0°F will carry and maintain a minimum terminal voltage of 9.0 for 30 seconds and 6.0 for 150 seconds.

BCI - Rating in amperes a battery cold soaked will carry and maintain a minimum terminal voltage of 7.2 for 30 seconds at 0°F and -20°F.

IEC - Rating in amperes a battery cold soaked at 0°F will carry for 60 seconds and maintain a minimum terminal voltage of 8.4.

BSR - Rating in amperes a battery cold soaked at 0°F will carry for 180 seconds and maintain a minimum terminal voltage of 6.0.

Rating Method	Temperature		Voltage	Ratings		Rated In:
	F•	C•		Time (seconds)	Amperes	
CA	32	0	1.2 / cell	30	{Rating}	Amps
RC	80	27	10.5	{Rating}	25	Minutes
AH	80	27	10.5	20 hours	{Rating}	Amp Hours
CCA (SAE)	0	-18	7.2	30	{Rating}	Amps
CCA (DIN/EN)	0	-18	9.0	30	{Rating}	Amps
			6.0	150	{Rating}	Amps
IEC	0	-18	8.4	60	{Rating}	Amps
BSR	0	-18	6.0	180	{Rating}	Amps
MCA	32	0	10.5	30	{Rating}	Amps
